Professional Summary

Senior Backend Java Engineer with **12 years** of experience at global leaders **Citi and SAP**. Specialized in designing and delivering **high-performance, low-latency distributed systems** for **FinTech** and **SaaS**, processing **20M+** records/hour while ensuring strict regulatory compliance. Proven expertise in **Java, Spring Batch, Spring Boot microservices** architecture, cloud-native deployments and leading projects in global cross-functional teams.

Education

Zhejiang University	Master's Degree of Software Engineering	2011 - 2013
Liaoning Normal University	Bachelor's Degree of System management	2007 - 2011

Technical Skills

- **Core Languages & Frameworks:** Java (8/17), Spring Batch, Spring Boot, Hibernate, Python.
 - **Distributed Systems:** Apache Ignite, Microservices Architecture, Apache Kafka.
 - **Database:** Oracle, Cassandra (NoSQL), SQL.
 - **Cloud & DevOps:** OpenShift, Maven, Git, CI/CD Pipelines, TeamCity, UDeploy, Docker, Jenkins.
 - **Other:** Agile/Scrum, TDD, JUnit/Mockito, SonarQube, Autosys
-

Professional Experience

Citigroup Services and Technology (China) Limited, Shanghai

Title: Senior Backend Engineer (AVP equivalent) | Jun 2019 – Oct 2025

Project: Citi Margin – MRNCCD (Margin requirements for non-centrally cleared derivatives)

Led development and architecture for Citi Margin (MRNCCD) platform – a mission-critical regulatory system calculating **Initial Margin, Variation Margin**, and **GMR risks** for non-centrally cleared derivatives, processing **20M+** records/hour during peak periods.

Key Achievements & Responsibilities:

- Designed and implemented core margin calculation engine using **Java, Spring Batch, Hibernate, Cassandra, and Oracle**, enabling ultra-low latency processing of massive financial datasets while meeting global regulatory deadlines.
- Optimized **data partitioning, hot/cold segregation, Cassandra** caching, and in-memory cache, achieving sustained throughput of 20M+ records/hour and reducing calculation delays with low latency.
- Developed high-throughput distributed **GMR risk** calculation system handling **20,000+ records/second** across 100+ daily raw data feeds.
- Architected and led migration from monolithic to **microservices** architecture using **Spring Boot** and **Apache Ignite**, delivering zero-downtime deployment and improved scalability.
- Led large-scale data source migrations, third-party library vulnerability remediation and **Java 17** upgrade **across global teams** in Shanghai, Pune, and U.S.
- Provided L3 production support as primary on-call lead, resolving critical incidents rapidly and reducing mean-time-to-recovery through proactive monitoring and troubleshooting.
- Enhanced code quality through 85%+ unit test coverage (JUnit/Mockito), SonarQube enforcement, and regular code reviews.
- Mentored team members, conducted technical interviews, collaborated with business analysts and trading desks to translate complex regulatory requirements into robust technical solutions.

Key Contributions in Metadata Service and CI/CD Pipeline Development:

- Designed and developed CD-Pipeline microservice using **Java, Spring Boot, Kafka**, and **REST APIs**, achieving 85%+ test coverage and seamless integration with global upstream/downstream systems. Services deployed on **Kubernetes** with a focus on high availability.
- Led and coordinated cross-data-center migration of 50GB **Elasticsearch** data with minimal downtime, ensuring zero data loss.
- Engineered automation frameworks for API and performance testing, reducing test execution time by 60% and increasing pass rates from 35% to 85%.
- Collaborated with international teams to continuously optimize system reliability, monitoring and deployment processes.
